

Abstract

The invention relates to a lubricating oil composition with good frictional properties, the composition having a lubricating oil and at least one additive having friction-reducing properties. The additive with friction-reducing properties is a block copolymer having hydrophobic segments P and polar segments D. The hydrophobic segments are obtained by polymerization of monomer compositions having a) between 0 and 40 wt. %, in relation to the weight of the monomer compositions for producing the hydrophobic segments, of at least one ethylenically unsaturated ester compound of formula (I), in which R represents hydrogen or methyl, R^1 represents a linear or branched alkyl radical having between 1 and 5 carbon atoms, and R^2 and R^3 independently represent hydrogen or a group of formula $-COOR'$, in which R' represents hydrogen or an alkyl group having between 1 and 5 carbon atoms.
